Heterogeneity of the genes encoding the major surface glycoprotein of Leishmania donovani.";

-1. Elschmania donovani.";

-1. FUNCTION: Has an integral role during the infection of macrophages in the mammalian host.

-1. CATALVIIC ACTIVITY: Preference for hydrophobic residues at Pl and Pl' and basic residues at P2 and P3'. A model nonapeptide is P1' and basic residues at P2 and P3'. A codel nonapeptide is clavaved at -Ala-Tyr-1-Leu-Lys-Lys-.

-1. Cataved at -Ala-Tyr-1-Leu-Lys-Lys-.

-1. COPACTOR: Binds 1 zinc ion per subunit (By similarity).

-1. SUBCELLULAR LOCATION: Attached to the membrane by a GPI-anchor.

-1. SIMILARITY: Belongs to peptidase family M8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             LEISHMANDLYSIN.

Mol. Biol. Evol. 10:127-139(1993).

-!- FUNCTION: Essential for biological clock functions. Determines the period length of circadian and ultradian rhythms; an increase in PER dosage leads to shortened circadian rhythms and a decrease leads to lengthened circadian rhythms. Essential for the circadian rhythmicaty of locomotor activity, eclosion behavior, and for the rhythmic component of the male courtship song that originates in the thoracton nervous system. The biological cycle depends on the rhythmic formation and nuclear localization of the TIM-PER complex. Light induces the degradation of the TIM-PER complex. Light induces the degradation of the heterodimer coordinatively regulates PER and TIM transcription through a negative feedback loop. Behaves as a negative element in circadian transcriptional loop. Does not appear to bind DNA, suggesting indirect transcriptional inhibition (By similarity).

-!- SUBUNIT: Forms heterodimer with timeless (TIM); the complex then transcroates into the nucleus (By similarity).
                                                                                                                                                                                                                                                                                                 241 YDÓLVÍRVVÍHEMAHALGESVVFFRDARILESISNVRHKDFDVPVINSSTAVAKAREQYG 300

Structure 6:1035-1046(1998).

-!- FUNCTION: Has an integral role during the infection of macrophages in the mammalian host.

-!- CATALYTIC ACTIVITY: Preference for hydrophobic residues at Pl and Pl' and basic residues at P2 and P3'. A model nonapeptide is cleaved at "Ala-Tyr-|-Leu-Lys-Lys-.

COPACTOR: Binds 1 zinc ion per subunit.
SUBCELULIAR LOCATION: Attached to the membrane by a GPI-anchor.
PTM: THE PHOSPHATIDYLINOSITOL MOIETY OF THE GPI-ANCHOR CONTAINS A FULLY SATURATED, UNBRANCHED 1-0-ALKYL CHAIN (MAINLY C24:0) AND A MIXTURE OF FULLY SATURATED UNBRANCHED 2-0-ACYL CHAINS (C12:0,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           N-LINKED (GLCNAC. . .) (POTENTIAL). N-LINKED (GLCNAC. . .) (POTENTIAL). GPI-anchor amidated asparagine.
                                                                                                                              C14:0, C16:0, AND C18:0).
SIMILARITY: Belongs to peptidase family M8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ZINC (CATALYTIC).
